

Investigating the activity dependent dynamics of synaptic structures using biologically realistic modelling of peripheral lesion experiments

Discussion of my Ph.D. research

Ankur Sinha
29/03/2019

1/18

Context

Plasticity while maintaining stability

2/18

Synaptic structures are dynamic in the adult brain

7/18

What we know from these experiments

- Massive disinhibition in the LPZ.
- Gradual ingrowth of excitatory synapses from the peri-LPZ to the LPZ.
- Gradual outgrowth of inhibitory synapses from the LPZ to the peri-LPZ.

9/18

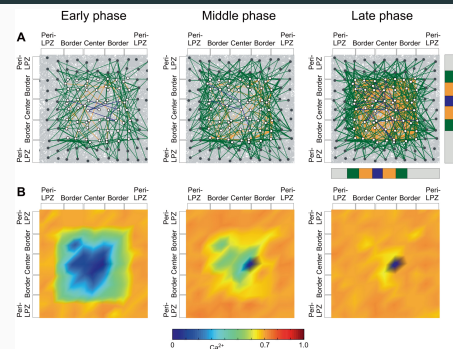

Computational modelling: MSP: turnover

- Synaptic structures (z): excitatory **and** inhibitory post-synaptic, excitatory **or** inhibitory pre-synaptic elements.
- New synapses form when **free** plugs are available: ($z > z_{conn}$)
- Synapses are deleted if: ($z < z_{conn}$)

12/18

Methods: our approach

Start with a biologically realistic network model

⁴Vogels, T. P. et al. Inhibitory plasticity balances excitation and inhibition in sensory pathways and memory networks. *Science* 334, 1569-1573 (2011)

13/18

Extensions

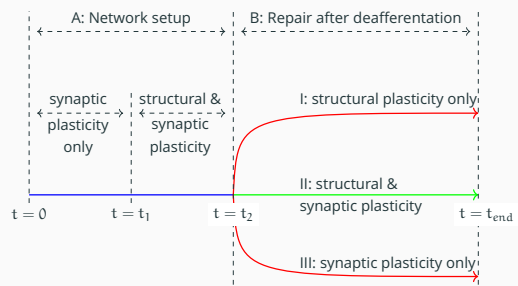

- Probabilistic formation of synapses, also: "longer" inhibitory than excitatory connections¹.
- Probabilistic deletion of synapses (incorporating evidence that stronger synapses have less likelihood of removal²).
- Further generalisation of growth curves.
