Notes		

Notes				

What we know from these experiments

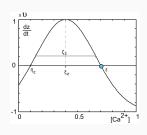

- Massive disinhibition in the LPZ.
- · Gradual ingrowth of excitatory synapses from the peri-LPZ to the LPZ.
- Gradual outgrowth of inhibitory synapses from the LPZ to the peri-LPZ.

8/18

Computational modelling: MSP: growth curve

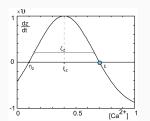

9/18

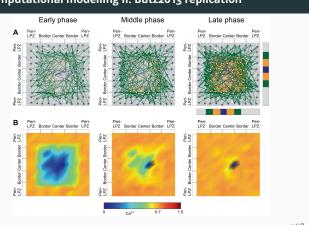

Computational modelling: MSP: turnover

- Synaptic structures (z): excitatory and inhibitory post-synaptic, excitatory or inhibitory pre-synaptic elements.
- New synapses form when free plugs are available: ($z>z_{\rm conn}$)
- Synapses are deleted if: $(z < z_{\rm conn})$

10/18

Computational modelling II: Butz2013 replication

12/18

Methods: our approach

Start with a biologically realistic network model

⁴Vogels, T. P. *et al.* Inhibitory plasticity balances excitation and inhibition in sensory pathways and memory networks. *Science* **334**, 1569–1573 (2011)

Extensions

- Probabilistic formation of synapses, also: "longer" inhibitory than excitatory connections¹.
- Probabilistic deletion of synapses (incorporating evidence that stronger synapses have less likelihood of removal²).
- Further generalisation of growth curves.
